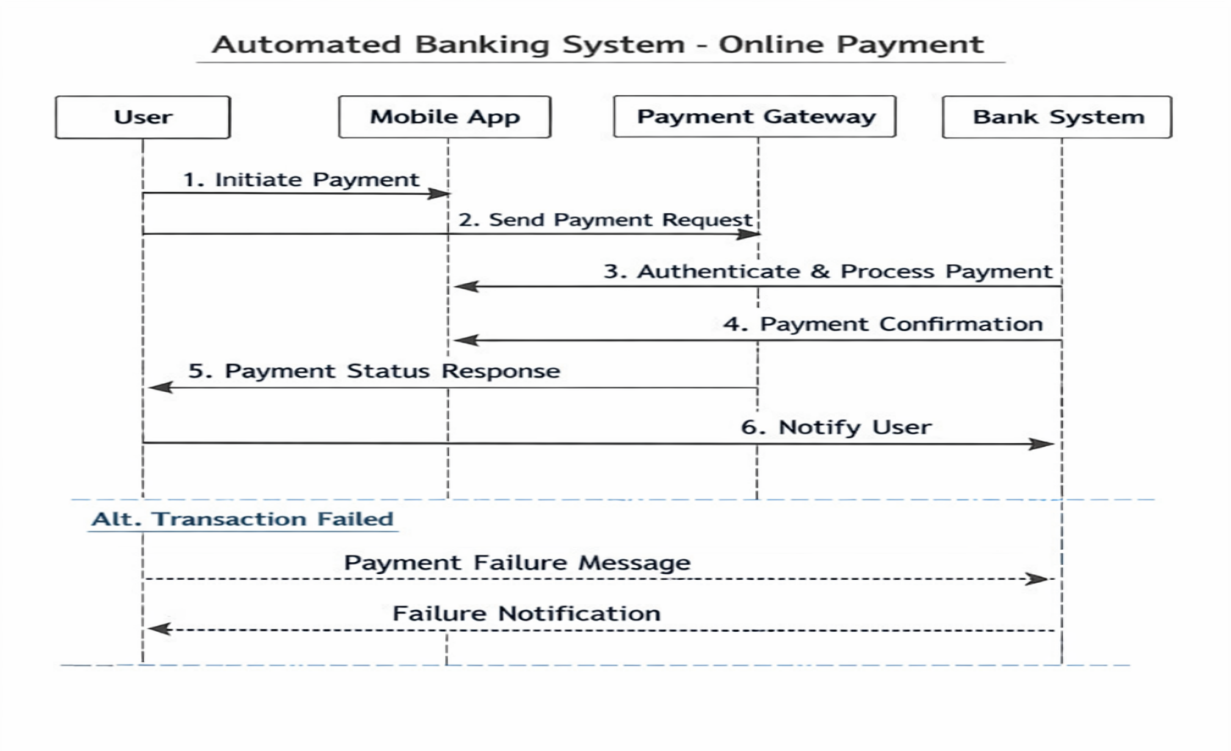
BANKING AUTOMATED SYSTEM – SEQUENCE DIAGRAM



Explanation

1. Payment Initiation

The user opens the mobile banking or payment application and enters the payment details such as amount and receiver. After reviewing the details, the user confirms the payment request. The application then prepares the transaction data and starts the payment process.

2. Request Submission

The mobile application sends the payment request to the payment gateway. The payment gateway forwards this request to the bank system for further verification and basic validation checks are performed.

3. Authentication and Verification

The bank system asks for user authentication such as PIN, OTP, or biometric verification. The user completes the authentication through the app. The bank system then verifies the credentials and checks the account balance and limits.

4. Transaction Processing

If all details are valid, the bank system processes the transaction. The amount is debited from the sender’s account and credited to the receiver’s account. The result of the transaction is sent back to the payment gateway and then to the application.

5. Confirmation or Failure Handling

If the transaction is successful, a success message is shown to the user. If the transaction fails due to any reason such as insufficient balance or network issues, a failure message is displayed with the reason.

6. Session End

After the transaction is completed, the session is closed. The user can either choose to make another payment or exit the application.
